

WHAT IS CLAIMED IS:

1. A specimen centrifuge apparatus comprising:
a rotating disc having a plurality of slots
arranged radially from a rotation axis of the rotating
5 disc; and
specimen container buckets mounted in the slots,
each of the buckets being located such that a
longitudinal direction of a container storing section
of the bucket containing a plurality of tube-type
10 specimen containers is set toward a radial direction of
the rotating disc and being shakably mounted such that
a bottom of the container storing section is set in a
circumferential direction of the rotating disc by
centrifugal force caused when the rotation disc
15 rotates.
2. The specimen centrifuge apparatus according to
claim 1, wherein the container storing section includes
a hollow, rectangular parallelepiped frame having
tube-type container holders which hold the tube-type
20 specimen containers.
